## **CLAIM AMENDMENTS**

1. (Currently Amended) In a switching amplifier of the type wherein one or more references are coupled to a load through gated switches controlled by a pulse-width modulated input signal, the improvement comprising:

adding a minimum pulse width of the same polarity to a pair of switching devices, one on either side of the load, to null the common-mode output presented to the load [[,]]

wherein each pair of switching devices is powered by a common reference.

- 2. (Original) The improved switching amplifier of claim 1, wherein the switches are arranged as differential pairs on either side of the load.
- 3. (Original) The improved switching amplifier of claim 1, wherein minimum pulse width is added during the pulse-width modulation of the input signal.
- 4. (Currently Amended) An enhanced performance switching amplifier coupling an input signal to a load, comprising:

at least one electrically controlled switch coupled to each side of the load <del>powered by a common reference</del>; and

a waveform generator operative to perform the following functions:

- a) control the switches in accordance with the input signal, and
- b) adding a minimum pulse width of the same polarity to both electrically controlled switches to null common-mode output presented to the load.
- 5. (Original) The improved switching amplifier of claim 4, wherein the switches are arranged as differential pairs on either side of the load.
- 6. (Original) The improved switching amplifier of claim 4, wherein minimum pulse width is added by the pulse-width modulator.
